SUMMARY

Full-stack engineer with 10 years shipping production applications, pairing React and TypeScript front ends with backend services and APIs in Python, Java, and Node.js over PostgreSQL. My background includes regulated financial systems at Wells Fargo, a high-traffic retail platform at JCPenney serving millions of users, and client work where I design the APIs and own features through production. I write well-tested, maintainable code, work closely with product and operations teams, and mentor junior engineers.

SKILLS

TypeScript, JavaScript, Python, Java, SQL | React, Next.js, Node.js, Django, Spring Boot | PostgreSQL, REST, GraphQL | AWS, Docker, GitHub, GitHub Actions, Jira

EXPERIENCE

Software Consultant — Lotnivo, Remote
March 2022 - Present

- Designed backend services and REST and GraphQL APIs in Python/Django and Node.js/TypeScript for 5+ client engagements, with PostgreSQL schemas, migrations, and tuned queries.
- Built customer-facing web apps and admin tools in React and TypeScript, from components to API integration.
- Moved tightly coupled systems onto independently deployable AWS services with Docker and GitHub Actions, which cut deploy time from hours to minutes and production incidents by roughly 40%.
- Added background jobs, scheduled tasks, and queued processing for third-party integrations, with retries and idempotency so a single failed call never stalls a workflow.
- Raised test coverage above 80% by setting testing and code review standards across contributors, and mentor junior developers through pairing.
- Cut manual review time by roughly 70% with a multi-stage LLM agent pipeline that screens hundreds of applications a week and holds every output for human approval.

Tech & tools: Python, Django, TypeScript, Node.js, React, Next.js, PostgreSQL, GraphQL, AWS, Azure, Docker, GitHub Actions, pytest, Jest, React Testing Library, Playwright, Jira, Claude Code, Codex, Cursor

Software Engineer — Wells Fargo, Charlotte, NC
May 2019 - June 2020

- Built and maintained backend REST services in Java with Spring Boot, implementing controller, service, and repository layers over relational data for internal financial applications.
- Connected React front ends to those services through a Node.js and Express middleware layer that handled sessions, validation, and errors in one place.
- Expanded the usable audience by over 25% with WCAG/ARIA accessibility and internationalization on every page, in a regulated codebase reviewed with security and compliance teams.

Tech & tools: Java, Spring Boot, React, Redux, JavaScript, Node.js, Express, REST APIs, Jest, Jira, Git

Software Engineer — JCPenney, Plano, TX
June 2017 - May 2019

- Improved load times for a high-traffic retail loyalty platform serving millions of users, and owned code quality through code reviews and production troubleshooting.
- Built front-end features in React and Redux and integrated them with backend services.
- Refactored a legacy monolith into a modular, component-driven architecture that was easier to scale and maintain.

Tech & tools: React, Redux, JavaScript, HTML, CSS, REST APIs, Jira, Git

OPEN SOURCE & HACKATHONS

PA Expunger (PAX) — Code for Philly and Philadelphia Lawyers for Social Equity
github.com/Philadelphia-Lawyers-for-Social-Equity/PA_Expunger

- Open source Python/Django and React app that turns county docket sheets into Pennsylvania expungement petitions, replacing manual drafting for the attorneys who file them.
- Contributed to deploying it so PLSE attorneys can use the live demo, working with Docker Compose, pytest, and an image-based deployment pipeline to a Kubernetes cluster.
- **Full Project Tech Stack:** Python, Django, React, PostgreSQL, Docker Compose, pytest, GitHub Actions, Kubernetes

Think-Wide — AI Agent Hackathon, September 2026
github.com/freebatteryfactory/think-wide-hackathon

- MCP servers and a React web workbench that give coding agents verified project context before they act.
- Designed the evidence-contract format that cuts hallucinated code references across repos, and the workbench records human corrections so they persist between agent sessions.
- Three developers and several AI agents merged 19 pull requests in one day on a contract-first TypeScript codebase, all behind 591 passing tests.
